

Rear Safety Bar Instructions

Rear Seats and Flip-Flops

Remove four bolts supplied from the welded nuts on the safety bar and position the horizontal part of the bar underneath the foot plate of the rear seat (Figure 1). Align the holes and insert bolts, lock washers, and flat washers and tighten using 14mm wrench. The safety bar is designed to aid in the entering and exiting of the rear seats. It is also used to hold the optional bag rack assembly (BGR UNV 5001K).

Figure 1

Note: for cars without pre-drilled step plate holes you will need to set safety bar in place and mark hole drilling area. Find center point for proper left to right alignment first.
